

Angolan National Customs Service

Axians, partnering with EMC, designed and implemented a backup solution based on the Avamar platform.

The Angolan National Customs Service operates 30 customs offices spread around a territory spanning 1.250.000 Km² with a 5400 Km land border. The long distances between several offices and the headquarters, combined with the fragility of the communications systems between sites, represents a huge challenge for both the headquarters – which needs reliable information, and remote offices – which need a way of gather and secure local information. This challenge determined the need for a platform capable of ensuring the integrity and availability of data used in these remote locations.

Axians, partnering with EMC, designed and implemented a backup solution based on the Avamar platform. The solution, composed of two different tiers (centralized and distributed) enables the customer to implement fast, easy and reliable backup and recovery methods for data used in remote offices. As of today, the customer plans to expand the system to several other offices of the Tax Authority.
