AXIANS implemented the structured wiring networks, an end-to-end telephone IP network

Bank of Mozambique (BdM) was created in 1975, with the mission of safeguard the national currency value and promote a sound and efficient financial sector. In 3 brand new buildings with more than 85.000m2 of total areas, AXIANS implemented the structured wiring networks, an end-to-end telephone IP network, with the respective connection to the public telephone network, including a call recording solution, as well as a new complete CPD with an integrated "APC/Schneider" type solution called "InfraStruXure". AXIANS also designed at the end of 2016 the architecture of CISCO network switches in several levels: access layer, distribution layer and core layer, to which a "Data Center Layer" is added. This network is currently under implementation. With the systems supplied and installed by AXIANS, BdM has a state of the art building that will allow them to grow their business with high flexibility, and be prepared for future challenges.
